

Project proposal: *portfolio website*

This is a portfolio website that displays the work I have done. It is all in one page and when you scroll through, each section changes background colour. At this stage I am imagining the colour palette to be soft, white-based pastels.

When an image is clicked in the bottom row it becomes the main image and the text changes to show a description of the project. When the large image is clicked, a pop-out box of the image appears and makes the rest of the background fuzzy until clicked outside of the image.

On this page the image is a pdf of my CV. When clicked, the cv pops out in a pop-up box, fading the outside as with the portfolio page.

Extras: on the bottom of the page there is a grey box labeled "potentially some sort of Javascript paceman goes here". This is where I might build a little Javascript pacman that moves when clicked. This all depends on the difficulty of this task and whether or not, once included, it adds something to the page (a moving element in an otherwise mostly-static page). It could also make the page look too busy, which will be considered.
